Mobility Innovations

amanda & forest presenting → A + F

1 2 3 ← judges Q'd (corresponds below)

C + N + A + M ← rest of autonauts

2. business idea = software as a service

what softw. & comput. requirements are needed for the OEM? & there needs to be a base sensor suite for autonomy

→ what are OEM req. → less risk of sunken cost

→ what are safety risks

→ manufacturing = sunken cost

condition: lvl 3/4 autonomy

2. target market = individual

but rideshare = just picks up next car

→ key to clarify

3. how would collaboration w/ parking garages work?

→ forest explained

3. curbside-to-curbside = picking up

clarification: is payment for pick up or just parking duration

1. ref slide at the end → w/ links

1. tables very small

1. how do you know spots are open?
    1. need existing infrastructure or api that can be accessed
    2. lacks reqs

↓

need a way to help w/ that → how to easily integrate

1. 'there's no curb to curb'
    → what to do when you can't park on the street
    → amanda: that's why this helps
    → edge case: or when TS is coming to rogers centre how can you find a spot when there's barely any
    → forest: referencing parking hero / other current apps w/o autonomy

↓

1. that app can become a benchmark for presentation

1. advice { higher price for events closer vs lower prices for events farther

→ forest response about natural traffic

1. what is upfront & recurring costs? needs to be incorporated

1. what is the data pipeline

2. ps calling out market size is good!
   → but gm currently looks at parking solutions
   → walk through industry competitor analysis & benchmarking

   2. call out autovalet
   → helpful for this

amanda: when benchmarking, would investors like transparency

   2. don't say what is not true
   ⇒ 1. data & assumptions must be realistic & called out

→ primarily gm & automotive

chad: are we expecting judges from the industry & similar comp format

→ same as wcx comp

chad: extra points for prototyping

* moving forward

→ hidden slides in backup section!

gm standard

but upload w/ pdf also new standard

Show we know everything that's going on
need solid system architecture design

→ running cost + initial cost

needs hardware component
→ this is a saas
→ and needs a harder emphasis

start technical then explain

key: won't work on every car
→ baseline requirements are needed

→ ex. lvl 4 or 5 autonomy

→ hey stare: 'can't solve w/ baselevel softwares

wireless networking module

→ uber vs box

chad vs vn

↓ car can pay

↓ working w/ lots that can pay

hybrid?

doesn't have to be IDEAL - just very clear

unclear:

how will parking lots be sourced?

good to show what kind of hardware / tech is needed

& note it's usually integrated
