

Autopark

Sunday, January 18, 2026 4:11 PM

- smart self parking that autonomously parks the car at the most convenient location.

⇒ Basic Outline:

⇒ How are parking spots detected?

- for indoor: ultrasonic sensors on the roof of each parking spot
- outdoors: Cameras on tall structures
- companies like THH securities & Park help provide the hardware for this

this data is given to Parking Data Aggregators, and they make this data accessible via APIs (Big players: INRIX & Passport, costs money).

This data along with the cost, location, distance will be fed to the recommendation algorithm.

⇒ V2V communication.

- most parking spots don't have these sensors, so we can find out how many spots are there by doing

total spots - cars that have been there for >30 min

- we can use other indicators such as cars going in circles, etc.
- cars can ask cars that are there if there are spots available, etc.

→ Our Software:

- The UI
- The recommendation model
- The V2V communication

System Design
